

**Amendments to the Specification:**

Please replace the paragraph beginning on page 2, line 1 of the specification with the following paragraph:

Accordingly, in one aspect the invention consists in a method for the secure distribution of digitised audio-visual works ("media") to consumers over a data network comprising the steps of:

encrypting said media using a different encryption key for each work ("media key"),

storing the encrypted media on one or more first servers,

storing the media keys on a second server,

making available one or more retail servers from which consumers may obtain the right to receive media keys for desired media in exchange for complying with conditions set by the retailer,

the consumer causing a request to be made from a network-connected client device to a selected retail server for at least the media key for a desired media work,

at the selected retail server, verifying the consumer has complied with the retailer's conditions, and if so,

the retail server either passing said request to the second server, or supplying to the client device data allowing the second server to be contacted,

at said second server verifying the allowability of fulfilling requests from said retail server or a client device and if so allowable encrypting the relevant media key and downloading it to either said retail server or said client device,

said retail server if receiving an encrypted media key from said second server, downloading said encrypted media key to said client device,

at the client device decrypting the received media key and storing it in memory in either encrypted or decrypted form,

subsequently, at the client device generating a request to the appropriate first server to supply the desired media work,

from the first server downloading the desired encrypted media work to said client device,

and

at the client device retrieving the media key from said memory and using it to decrypt the media work to a condition where it can be played using appropriate player software.

Please replace the paragraph beginning on page 2, line 28 of the specification with the following paragraph:

The inventive concept may also be applied to the secure distribution of other digitised products over the Internet. Accordingly in a further aspect the invention consists in a method for the secure distribution of digitised products to consumers over a data network comprising the steps of;

encrypting said products using a different encryption key for each product ("product key"),

storing the encrypted product on a first server,

storing the product keys on a second server,

creating steering files corresponding to each product and its corresponding key,

said steering files containing information identifying the media work and the respective locations of the product and product key,

making available on a third server steering files corresponding to each product for consumers to purchase,

said steering files when executed on a network-connected client computer device accessible to the consumer causing a request to be made to said second server for the key for the product identified in the steering file,

at the second server encrypting the relevant product key with a key unique to the consumer and downloading it to said client device,

decrypting the product key at said client device and storing it in memory in either encrypted or decrypted form,

subsequently, generating a request to the first server from said client device to deliver the product identified in the steering file,

downloading the encrypted product from said first server to said client device,

retrieving the product key from said memory and using it to decrypt the product to a condition where it is ready for use.
